Storage systems based on the second use of discarded electric vehicle batteries have been identified as cost-efficient and sustainable alternatives to first use battery storage systems.

Key points The rise in renewable energy utilization is increasing demand for battery energy-storage technologies (BESTs). BESTs based on lithium-ion batteries are being developed and deployed.

However, despite its importance, there are still important gaps in the scientific literature. Therefore, the objective is to examine the research trends on the use of secondary batteries for ...

Storage systems based on the second use of discarded electric vehicle batteries have been identified as cost-efficient and sustainable ...

Energy storage systems use more electricity for charging than they provide when supplying electricity to the electricity grid. Secondary sources of electricity such as batteries are ...

Compared to the high demands for energy density and power density in automotive power systems, other applications like energy storage have relatively lower requirements, thus creating objective ...

In view of this, the paper investigates the quantification of the environmental benefits of second-use batteries, and comprehensively evaluates the second-use batteries energy storage ...

Executive summary Batteries are an essential part of the global energy system today and the fastest growing energy technology on the market Battery storage in the power sector was the fastest ...
